

Design Document Template

September 4th 20XX

OBJECTIVE

Create an input field that will assign a description to a playlist within the Jammming application

BACKGROUND

This feature actually isn't important. I just got done trying to figure out a project that has taken about 30x longer than it perhaps needed to. This feature adds basic functionality to a project that quite frankly still doesn't quite work

This feature does the following:

1. Gives the user the ability to add a description to a playlist, like most playlists do

TECHNICAL DESIGN

The component should be comprised of a textarea element that gives the user the ability to enter a playlist description

The component should use a state defined in App.js to submit the input

The component will have to use a method that updates the state of that playlist as text is being entered

Component should match overall design of the app

CAVEATS

Spotify Playlists may have a character limit
